Shoolini University

Final Project Report – Completion Stage

Submission Date: 25 November 2026

---

1. Student Details

Name	Md Faiz Alam
Course	BCA (Bachelor of Computer Applications)
Semester	6th Semester
Admission No.	UGO24156735
Project Title	StockFlow – Inventory Management System for Small and Medium Businesses
GitHub	https://github.com/Md-Faiz-Alam/inventory-management-system
Live App	https://stockflow-inventory-0qr7.onrender.com

2. Project Title & Objective

Title: StockFlow – Inventory Management System for Small and Medium Businesses

Objective: StockFlow is a fully deployed, web-based inventory management system for small and medium businesses that still keep stock in registers or spreadsheets. It keeps an exact, real-time record of every product and every unit that comes in or goes out, with who made the change and why. On top of that record it manages suppliers, purchase orders, customers and sales orders, produces invoices and reports, and gives managers a live dashboard that shows what needs reordering – all accessible from any device through a web browser.

3. Final Features Implemented

Access and security

- Secure sign-in with four roles: Admin, Manager, Staff and read-only Viewer.
- One-click Explore as guest for visitors: every page can be viewed, nothing can be changed.
- User management: add users, change roles, deactivate accounts and set new passwords.
- Account lock for 15 minutes after five failed sign-ins (web page and API).

- Activity log of every create, edit, status change, stock operation, order step and sign-in, with old and new values and the IP address.
- HTTPS only, secure cookies, CSRF protection and browser security headers in production.

Inventory

- Product catalogue with unique SKUs, categories, prices and reorder levels; archive instead of delete.
- Receive and issue stock through one locked, transactional service; stock can never go negative and double submissions are ignored.
- Complete movement history; corrections by reversal or stocktake.
- Low-stock and out-of-stock indicators and a top-bar alert that refreshes every minute.

Purchasing and sales

- Suppliers linked to the products they provide.
- Purchase orders with partial deliveries, delivery document numbers, progress and cancellation.
- Customers and multi-line sales orders (Draft → Confirmed → Fulfilled); fulfilment issues all lines in one transaction or none.

Insights and documents

- Analytics dashboard: stock value, product and unit totals, low/out-of-stock counts, open purchase orders, monthly sales, plus charts of stock in vs. out (30 days), stock health, value by category and fastest-moving products.
- Stock and movement reports with filters, exported as CSV or PDF.
- PDF purchase orders and tax invoices / quotations.

Interface and integration

- Live search and filtering without page reloads (HTMX) on every list.
- Responsive design for desktop and mobile, with light and dark themes.
- Public landing page showing live figures from the database.
- REST API (products, suppliers, customers, stock movements, purchase and sales orders) with token sign-in and interactive Swagger documentation.

4. System Working Explanation

Architecture

StockFlow is a Django web application backed by PostgreSQL. Pages are rendered on the server and made interactive with HTMX and Chart.js; a REST API exposes the same data to other programs. Every stock change – from a page, a purchase order, a sales order or the API – goes through one service function that locks the product row, checks the rules and writes an unchangeable movement record, which keeps balances correct even when several users work at the same time.

Layer	Technology
Backend	Python 3.11, Django 5.2, Django REST Framework, drf-spectacular
Database	PostgreSQL 17 (Docker locally, Neon in production)
Frontend	HTML, CSS, JavaScript, HTMX, Chart.js
Documents	xhtml2pdf (PDF), CSV export
Testing and CI	Django test framework (217 tests), GitHub Actions
Hosting	Render (Gunicorn + WhiteNoise) and Neon PostgreSQL

Step-by-step working

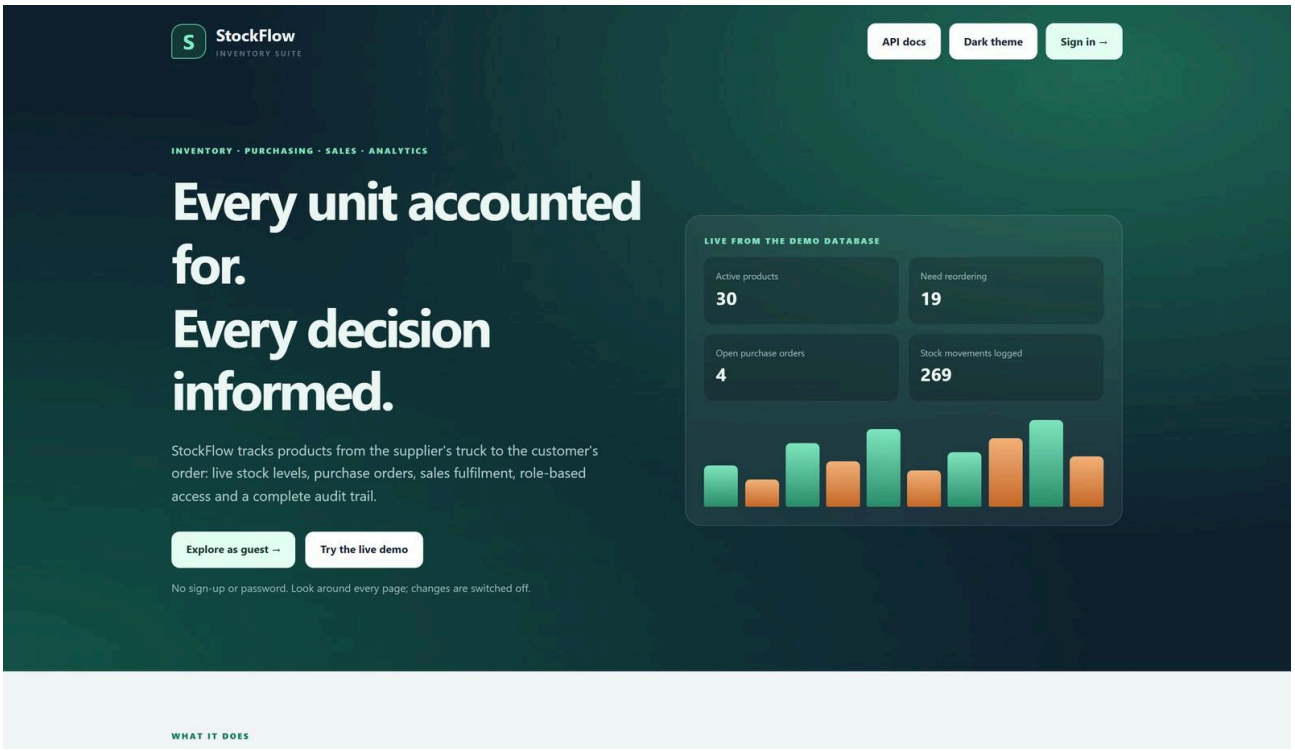

- Step 1 – Visit: the landing page shows what the system does and live totals. A visitor can click Explore as guest (read-only) or sign in.
- Step 2 – Sign in: the user's role decides which menu items and actions appear; every page also checks permissions on the server.
- Step 3 – Dashboard: key figures and four charts are loaded from the database; the alert bell shows how many products are at or below their reorder level.
- Step 4 – Catalogue: a Manager adds products and suppliers and links them; lists update instantly while typing in the search box.
- Step 5 – Purchase: from a low-stock product, the Manager raises a purchase order (supplier and cost are pre-filled) and can download it as a PDF.
- Step 6 – Receive: when goods arrive, Staff record the delivery against the order; stock rises and the order shows what is still outstanding.
- Step 7 – Sell: a sales order is created for a customer, confirmed by a Manager and fulfilled by Staff, which issues stock for every line; a tax invoice PDF is then available.

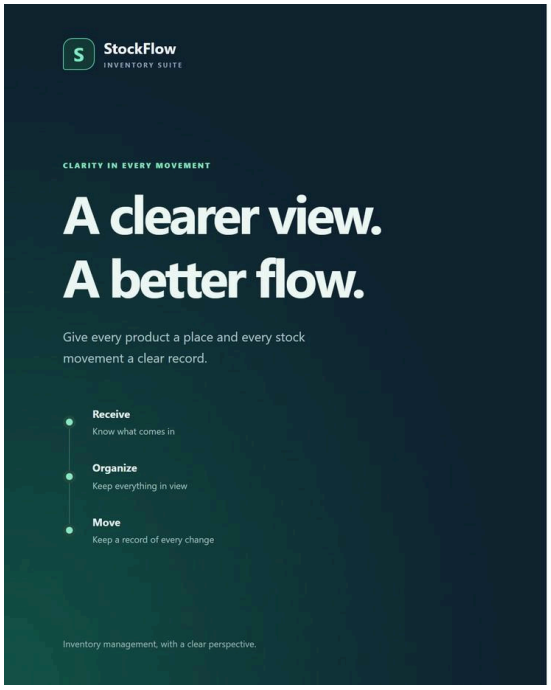

- Step 8 – Correct: mistakes are fixed by reversing a movement or by a stocktake, so history is never edited or lost.
- Step 9 – Review: reports (HTML, CSV, PDF), the movement history and the activity log show exactly what happened, when and by whom.

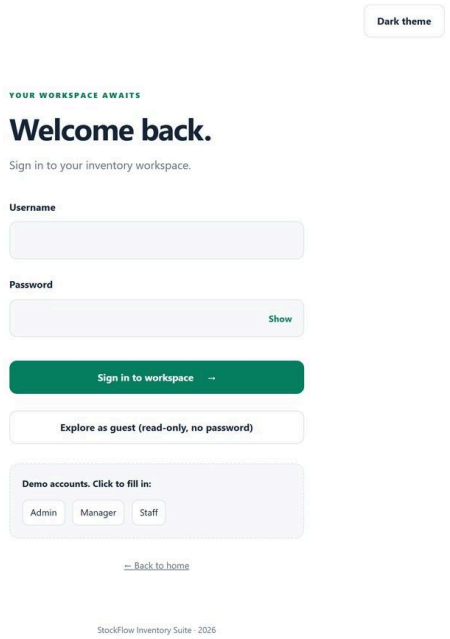

Testing and deployment

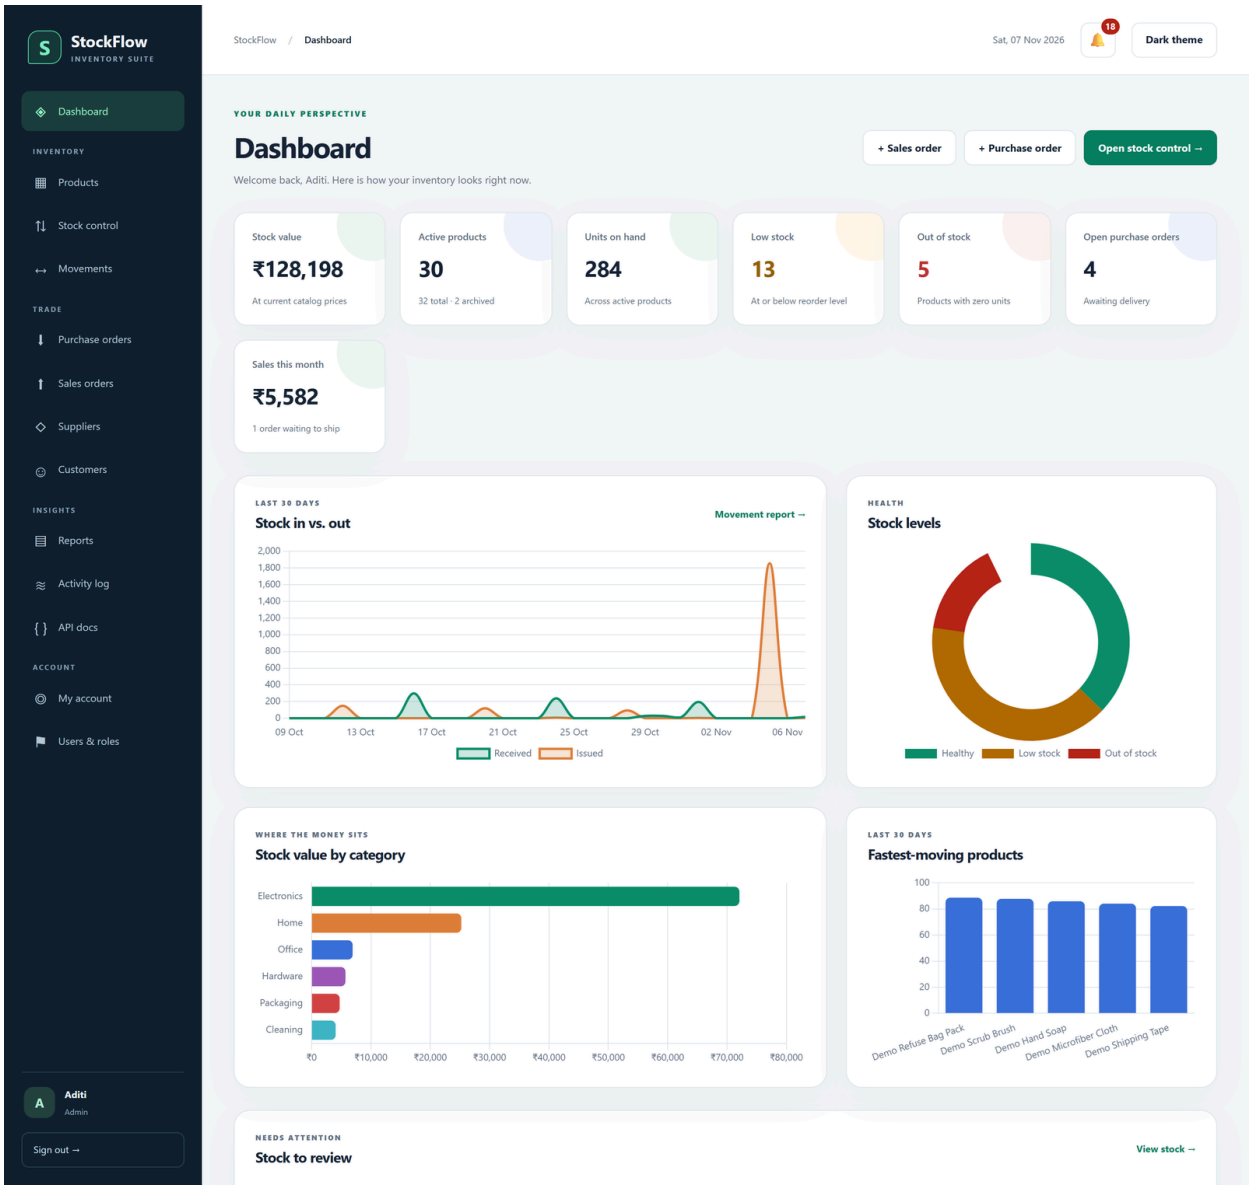

- 217 automated tests cover every module, including simultaneous stock operations, permissions for each role, the API, PDFs and the guest view.
- GitHub Actions runs on every push: tests on PostgreSQL 17, migration checks, demo data loading, production security checks and a server start-up test.
- A website checker script signs in like a visitor and opens every page, export, PDF and API endpoint. On the live site: 66 checks passed, 0 failed.
- Deployed on Render (free web service) with a Neon PostgreSQL database. Every push to GitHub redeploys automatically; HTTP is redirected to HTTPS.

6. Conclusion

StockFlow was successfully built in stages and deployed as a fully working web application. It meets its objective of giving a small business an accurate, real-time and accountable record of its stock, together with purchasing, sales, reporting and analytics, available from anywhere.

What was achieved

- A complete inventory, purchasing and sales system built with Django and PostgreSQL.
- Stock balances that stay correct under simultaneous use, with a full, permanent history.
- Role-based access, a read-only guest view and a complete activity log.
- A dynamic interface with live search, charts, PDF documents and a documented REST API.
- Automated testing on every change and a live deployment on free cloud hosting.

What I learned

- Designing a relational database and keeping data consistent with transactions and row locking.
- Building secure web applications: authentication, permissions, CSRF, HTTPS and protection against repeated sign-in attempts.
- Writing automated tests and running them in a continuous-integration pipeline.
- Building REST APIs and making pages dynamic without a separate frontend framework.
- Deploying with environment variables, managed databases and production security settings, and using Git for version control.

Future scope

- Barcode / QR-code scanning for receiving and issuing stock.
- Email or SMS alerts when products fall below their reorder level.
- Multiple warehouses or store locations with stock transfers.
- GST tax calculation on invoices and integration with accounting software.

7. Project Files Submission

The complete source code is available on GitHub (https://github.com/Md-Faiz-Alam/inventorymanagement-system) and the working system at https://stockflow-inventory-0qr7.onrender.com.

The submission file UGO24156735.zip contains:

Item	Contents
Source code	The full StockFlow project: Django apps (accounts, inventory, suppliers, sales, reports, audit, api), templates, static files, migrations, tests, requirements.txt, render.yaml and build.sh. Secret files (.env) are not included.
README.md	Features, local setup steps, testing commands and deployment guide.
Reports	Progress Report 1, Progress Report 2 and this Final Project Report (PDF).
Links	GitHub repository and live application URLs.
